## Exercise 8.1

Figure 8.31 shows the ACFs for 36 random numbers, 360 random numbers, and 1,000 random numbers.

**a**

Explain the differences among these figures. Do they all indicate that the data are white noise?

Figure 8.31: Left: ACF for a white noise series of 36 numbers. Middle: ACF for a white noise series of 360 numbers. Right: ACF for a white noise series of 1,000 numbers.

**b**

Why are the critical values at different distances from the mean of zero? Why are the autocorrelations different in each figure when they each refer to white noise?

## Exercise 8.2

A classic example of a non-stationary series is the daily closing IBM stock price series (data set `ibmclose`). Use R to plot the daily closing prices for IBM stock and the ACF and PACF. Explain how each plot shows that the series is non-stationary and should be differenced.

## Exercise 8.3

For the following series, find an appropriate Box-Cox transformation and order of differencing in order to obtain stationary data.

**a**

`usnetelec`

**b**

`usgdp`

**c**

`mcopper`

**d**

`enplanements`

**e**

visitors

## Exercise 8.5

For your retail data (from Exercise 3 in Section 2.10), find the appropriate order of differencing (after transformation if necessary) to obtain stationary data.

## Exercise 8.6

Use R to simulate and plot some data from simple ARIMA models.

**a**

Use the following R code to generate data from an AR(1) model with  $\phi_1 = 0.6$  and  $\sigma^2 = 1$ . The process starts with  $y_1 = 0$ .

**b**

Produce a time plot for the series. How does the plot change as you change  $\phi_1$ ?

**c**

Write your own code to generate data from an MA(1) model with  $\theta_1 = 0.6$  and  $\sigma^2 = 1$ .

**d**

Produce a time plot for the series. How does the plot change as you change  $\theta_1$ ?

**e**

Generate data from an ARMA(1,1) model with  $\phi_1 = 0.6$ ,  $\theta_1 = 0.6$  and  $\sigma^2 = 1$ .

**f**

Generate data from an AR(2) model with  $\phi_1 = -0.8$ ,  $\phi_2 = 0.3$  and  $\sigma^2 = 1$ . (Note that these parameters will give a non-stationary series.)

**g**

Graph the latter two series and compare them.

## Exercise 8.7

Consider `wmurders`, the number of women murdered each year (per 100,000 standard population) in the United States.

**a**

By studying appropriate graphs of the series in R, find an appropriate ARIMA(p,d,q) model for these data.

**b**

Should you include a constant in the model? Explain.

**d**

Fit the model using R and examine the residuals. Is the model satisfactory?

**e**

Forecast three times ahead. Check your forecasts by hand to make sure that you know how they have been calculated.

**f**

Create a plot of the series with forecasts and prediction intervals for the next three periods shown.

**g**

Does `auto.arima()` give the same model you have chosen? If not, which model do you think is better?
